

PLEASE READ CAREFULLY

This Motorola Canopy radio has been converted to accept an external antenna. Please read and obey all warnings. Negligence may cause permanent damage to the radio.

WARNINGS

1. Do not pull on, or hold the radio by, the N-connector cable.
2. Do not connect, or disconnect, the radio to the antenna feed while the radio is turned on.
3. Do not power on the radio without an antenna connected to it.
4. Do not crimp the N-connector cable. The cable should be straight or have a large bending radius at all times.
5. Be cautious when installing the bottom radio cover, as the N-connector cable may become caught.

For testing procedures it was required to reset the Canopy radio back to factory default settings. The IP Address is currently set at the default of 169.254.1.1. Please use this address to access the radio.

In order to make the antenna connection weather-resistant, it is important to fasten the N-connector. After the radio is attached to the antenna, wrap the entire N-connector in self-adhesive vulcanizing tape. This not only protects the connector from the weather elements, but decreases the odds of the connection becoming loose. It is suggested to cut the tape with an angled cut so the end piece does not come loose.
